

TRELLIS DESIGN

Grapevine Trellis Optimization

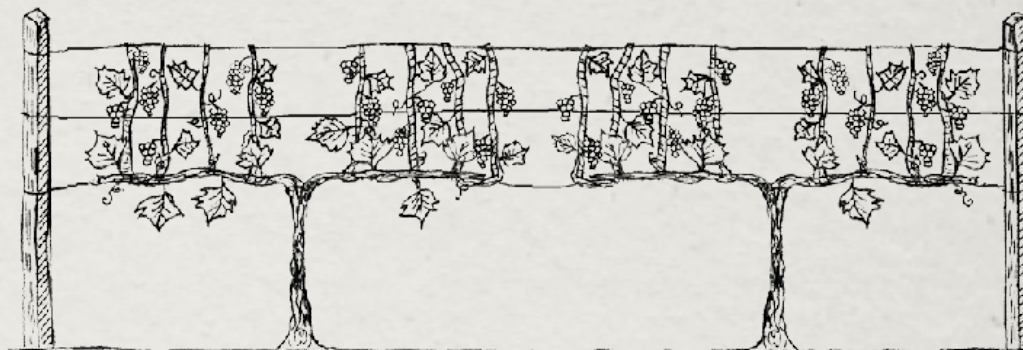

Hanging Curtain

Permanent canes spread out fruit across a large zone, increasing cluster counts and reducing bunch and berry size for higher quality.

Vertical Shoot Positioning (VSP)

Annual cane growth is positioned to grow upright allowing for easy canopy manipulation such as hedging, leaf pulling and green drop to improve quality.

Smart-Dyson

A split canopy that allows for 2/3's of the canes to grow up and 1/3 down, resulting in improved fruit distribution with better sun exposure.
